

To Whom It May Concern,

I am writing to express my deep concern and strong opposition to the ongoing aerial shooting of bears in Alaska. The fact that over 200 bears have already been killed—and that many more are expected to be culled—raises serious ethical, ecological, and public accountability issues.

Bears are a critical part of Alaska's ecosystem. They play essential roles in maintaining balance in wildlife populations, dispersing seeds, and supporting overall forest health. Removing them in such large numbers not only disrupts this delicate balance but also damages the natural heritage that makes Alaska unique.

The method being used—shooting bears from helicopters—is both inhumane and reckless. It leads to unnecessary suffering, often wounding animals instead of killing them instantly. This practice is not only cruel but also inefficient, imprecise, and out of step with modern conservation principles.

The justification for these killings—expanding public access and recreational opportunities—is short-sighted. Public enjoyment of wild spaces should not come at the cost of destroying the very wildlife that makes these spaces special. True conservation balances human interests with respect for nature. What's happening now is a step backward.

I urge policymakers and wildlife officials to halt the aerial bear killings immediately and to reconsider any wildlife management strategy that favors mass killing over science-based, humane, and ecologically responsible practices.

Alaska's wilderness is admired around the world for its beauty and biodiversity. Let's protect that legacy, not diminish it.

Sincerely,

Scott Carroll
