

**Marie Heurtebize**

I am firmly against the killing of bears and grizzlies in Alaska. These animals play a vital role in maintaining a healthy ecosystem, and there is no solid scientific evidence that killing them actually helps increase caribou populations. In fact, nature is far more complex than simply removing one predator to benefit another species. This approach is based more on outdated assumptions than real results.

Bear hunting for the sake of population control is not only inhumane—it's ineffective. Instead of disrupting the natural balance, we should be focusing on responsible wildlife management, habitat protection, and science-based solutions. Alaska's wild beauty depends on its predators just as much as its prey. If we truly value our environment, we must protect all parts of it—including its iconic bears.
